Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence is used in a method which involves the production of CC catalytic DNA molecules which can be used for cleaving target nucleic CC acid molecules. Such DNA molecules can be used in pharmaceutical and CC medical products (e.g. for wound debridement, clot dissolution), as well cas in household items (e.g. detergents, dental hygiene products, meat CC tenderisers'). Other suitable substrates include those comprising or CC produced by picornaviruses, hepadnaviridae, (e.g. HBV, HCV), produced by picornaviruses, hepadnaviridae, (e.g. HBV, HCV), CC papitiomaviruses (e.g. HPV), gammaherpesvirinae (e.g. EBV), CC lymphocryptoviruses, leukemia viruses (e.g. HTLV-1 and -11), productiviruses, togaviruses, cytomegaolviruses (including alphaherpesviruses) criviruses and retroviruses contributing to immunodeficiency diseases and covine leukemia viruses. They can also be used as regulators of gene expression.
                       Identifying sites on a target or in vitro-synthesized RNA accessible antisense, ribozyme, or DNAzyme binding comprises incubating hybridizing the target RNA with an antisense oligodeoxynucleotides,

                                                                                                                                                                                                                                                                                                                                     with DNAzymes, antisense oligonucleotides or ribozymes (such as the present sequence). Any antisense oligonucleotide, ribozyme or DNAzyme which is complementary to an accessible site in the target sequence hybridises to that site and the sequence is cleaved. The cleavage products can then be detected to identify the accessible binding sites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present sequence). Any antisense oligonucleotide, ribozyme or DNAzyme which is complementary to an accessible site in the target sequence hybridises to that site and the sequence is cleaved. The cleavage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               target RNA which are accessible to pairing by antisense DNA, ribozymes on DNAzymes. The present sequence is a DNAzyme catalytic core sequence. In the method of the present invention the target sequence is incubated with DNAzymes, antisense oligonucleotides or ribozymes (such as the
                                                                                                                                                                                                                                                                  Sequence 16

(Ī) is useful in diagnostic applications to identify the presence of genes and/or gene products indicative of a particular genotype and/or phenotype, e.g. a disease state or infection and for diagnosis of disease states or physiological abnormalities related to the expression of viral, bacterial or cellular RNA and DNA. (I) is useful in nucleic acid-based electronics, for the detection of specific target signalling molecules, in assays to assess the specificity, toxicity and effectiveness of various small molecules, nucleoside analogues or non-nucleic acid drugs or for detection of pathogens, biochemicals, organic or inorganic compounds. The present sequence is that of a DNAzyme motif of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid sensor molecule useful in diagnostic applications, nucleic acid-based electronics and functional genomics, comprises a enzymatic nucleic acid and one or more sensors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid sensor molecule; detection; infection; disease physiological abnormality; electronic; signalling molecule;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               03-FEB-2000; 2000US-0179983

```
CC expression of a CD20 gene and a nucleic acid molecule which down regulates CC expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO).

CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYA possessing an NCH motif), a G-cleaver (cleaving RNA with a NYA molecule CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYA molecule CC (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used CC (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used CC (cleaving RNA with a YGY motif). The CD20-targetting nucleic acid is used CC cpederably Mg^2+. Furthermore, it may be contacted with a cell to reduce CC cp20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the CC use of one or more therapies. In particular, the CD20 targetting CC lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, HIV (human 10w-grade or follicular non-Hodgkin's lymphoma (NHL), bulky CC immunocytoma (IMC), small B-cell lymphocytic lymphoma (NHL), immune conception of that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a concleic acid is used to cleave RNA of the NOGO gene in the presence of a concleic acid is used to cleave RNA of the NOGO activity of the cell and creatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

CC treatment may further comprise the use of one or more therapies.

                                                                                                                                                                                                                                                                                                                                                           The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chronic bronchitis; cystic fibre oxygen therapy; bronchodilator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; chloride channel calcium activated 1; CLCA1; ss; antiasthmatic; antiinflammatory; chronic obstructive pulmonary disease; COPD; asthma;

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome

Disclosure; Figure 5; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates conditions selected from cancer, lymphoma, Eusful for treating conditions selected from cancer, lymphoma, Eusful for treating cumour angiogenesis, diabetic retinopathy, macular degeneration, neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca culgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu creating a patient having a condition associated with the level of ERG, by contacting a patient having a condition associated with the level of ERG, cunder conditions suitable for the treatment. The method comprises the use of one or more therapies conjunction with one or more of other treatment or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction such as Mg2+. (I) is useful for reducing ERG activity in a cell, by contacting the cell with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and conjunction such as Mg2+. (I) is useful for diagnosis of conditions and conjunction of ERG RNA in a cell. (I) is useful for specifically cation such as Mg2+. (I) is useful for diagnosis of conditions and conjunction of ERG RNA in a cell. (I) is useful for specifically cation spens that share homology with ERG gene or ERG fusion genes. ABK17354-ABK2719 represent nucleic acid molecules which regulate expression of ERG, and conjunction of the invention.

cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg'2'+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as characteristic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; lung cancer; prostate cancer; colorectal cancer; prain cancer; cosphageal cancer; stomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methotrexate; cyclophosphamide; doxorubin; fluorouracil carboplatin; deterexate; genecitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenosis; Crohn's disease; besity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               នន្តន្តន្តន
The present sequence is an example of a DNAzyme, an enzymatic CC nuclear acid (ENA) that does not require the presence of a 2'-OH CC group for its activity. DNAzymes can be used as the ENA moiety in CC novel ENA peptide conjugates (I) of the invention that facilitate CC delivery of molecules into biological systems, such as cells. The CC peptide part of the conjugate is typically a fluored peptide such cas a peptide given in ABP72298-ABP72305. The conjugates can be CC used to treat a cancer patient, where the cancer is breast, lung, CC colorectal, brain, oesophageal, stomach, bladder, pancreas, crivic, head and neck or ovary cancer, melanoma, lymphoma, glioma or CC the virus is HIV, hepatitis B virus, hepatitis C virus, cous sarcoma virus, hepatitis C virus, CC thougalovirus, Rous sarcoma virus, hepatitis C virus, Ebola virus, foot and mouth disease virus or papilloma virus (all colaimed). (I) are useful for introducing nucleotides, proteins cand/or non-nucleosidic small molecules into a cell and to detect the presence of a target molecule in a biological system such as CC tissue, cell or cell lysate. They are useful as diagnostic tools cto examine genetic drift and mutations within diseased cells or to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                          The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABS62217 - ABS64543, ABS65532 - ABS65519,

                                                                                                                                                                                                                                                                                             acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519, ABZ66525 - ABZ66529, ABZ66586 - ABZ66588 represent human ribozymes of the

The method comprises: (i) amplifying, in an isolated sample from the subject, the nucleic acid segment that, in an affected individual contains (A), (ii) treating the amplicons with a creatly tic nucleic acid (I) that specifically recognizes and cleaves a creatly tic nucleic acid (I) that specifically recognizes and cleaves a creatly tic nucleic acid (I) that specifically recognizes and cleaves a creatly to both; and (iii) detecting any cleavage caused by (I). Step but not in both; and (iii) detecting any cleavage caused by (I). Step but not diagnose cancer (especially), acquired immune deficiency considered concurrently with (I). The method is specifically create syndrome and cystic fibrosis. (I) recognises as few as two by to create concurrency expecially, acquired immune deficiency such sites creative and expecially than restriction enzymes and mismatched occur more frequently than restriction enzyme sites, and mismatched is potentially more flexible than REIP and does not require any enzymes or concurrency used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present invention describes a method for determining whether a cc subject is afflicted with a disorder characterised by the presence of a known nucleic acid. The method comprises: (1) amplifying, in an cl isolated sample from the subject, the nucleic acid segment that, in an catalytic nucleic acid (1) that specifically recognizes and cleaves a cc catalytic nucleic acid (1) that specifically recognizes and cleaves a cc catalytic nucleic acid (1) that specifically recognizes and cleaves a cc catalytic nucleic acid (1) that specifically recognizes and cleaves a cc catalytic nucleic acid (1) that specifically recognizes and cleaves a cc catalytic nucleic acid (1) that specifically recognizes and precisions of the method is specifically cc (1) may be performed concurrently with (1). The method is specifically cc used to diagnose cancer (especially), acquired immune deficiency cc syndrome and cystic fibrosis. (1) recognises as few as two bp to create a cleavage site (contrast at least 4 bp required by enzymes used in a cleavage site (contrast at least 4 bp required by enzymes used in a cleavage site contrast than restriction enzyme sites, and mismatched cc primers can be used to induce cleavage sites for (1). The method is primers can be used to induce cleavage sites for (1). The method is cc contrailly more flexible than RFLP and does not require any enzymes or toxic compounds. AAZ3433 to AAZ34450 represent oligonucleotide cc sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC quantitative real-time determination of nucleic acid (I) using a primer CC attached to a 1-40 nucleotide sequence (II) in the transcription product. CC Amplification is done in the presence of an excess, preferably 50-500 nM, CC of a nucleic acid probe (III) and labeled by a reporter molecule and a CC quencher molecule. (I) encodes the motif 5'-GAAA-3' (A), and (II) CC contains the motif 5'-CUGANCA-3' (B). (III) has 25-60, especially 50, CC nucleotides. The method is used to detect and quantify (I) from CC pathogenic bacteria. The method allows real-time detection and CC quantification of (I), particularly RNA by NASBA (RTM) (nucleic acid Sequence-based amplification), without the difficulties associated with CC use of DNA probes (see Nucleic Acid Res., 26 (1998) 2150) and is suitable CC to routine use. Specifically the combination of (A) and (B) generates a CC hammerhead ribozyme that cleaves the probe and generates a fluorescent CC signal. Since many probes are cleaved, a high signal is produced, CC resulting in high sensitivity and shorter reaction times. The method is CC resulting in high sensitivity and shorter reaction times the method is CC cleavage results in dissociation of the probe to target is necessary CC for roleavage to occur. Complicated probes are not required because CC cleavage results in dissociation of the probe from the target (which CC consisting mainly of 2'-deoxyribonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ62217 - ABZ64543, ABZ65532 - ABZ65519,
                                                                                                                                                           Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-R human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ65217 - ABZ66543, ABZ65532 - ABZ66529, ABZ66529, ABZ66586 - ABZ66588 represent human ribozymes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 29-MAY-2001;

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ra human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ66217 - ABZ66583 - ABZ65532 - ABZ65519, ABZ66529, ABZ6659, ABZ66586 - ABZ66658 represent human ribozymes of the sequences and ABZ65217 - ABZ66586 - ABZ66588 represent human ribozymes of the sequences and ABZ65219, ABZ66529, ABZ66586 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66586 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66586 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66586 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66586 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66588 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66588 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66588 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66588 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66588 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66588 - ABZ66588 represent human ribozymes of the sequences and ABZ6529, ABZ66588 - ABZ66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.
